Sol-Gel methods The sol-gel process may be described as: •Formation of an oxide network through polycondensation reactions of a molecular precursor in a liquid. • A sol is a stable dispersion of colloidal particles or polymers in a solvent.

Sol-gel Method. Sol-gel method is a widely employed wet method to prepare materials, which can be simply expressed as conversion of monomers into a colloidal solution (sol) acting as the precursor for an integrated network (gel) of either discrete particles or network polymers.

Sol-gel processing is a soft-chemistry method to obtain functional materials at low temperatures. This route can be used to produce very sophisticated nanomaterials and to tailor the materials to very specific applications.

A sol-gel method was used to entrap lipase on cellulose acetate gel fiber with an average diameter of 500  $\mu\text{m}$  (Ikeda and Kurokawa, 2002). In catalyzing the esterification of ibuprofen with propyl alcohol, the immobilized lipase demonstrated better enantioselectivity compared with crude lipase.

Our interest is on sol gel method. Sol-gel process is a wet-chemical technique widely used in the fields of materials science and ceramic engineering. It is used primarily for the fabrication of materials (typically metal oxides) starting from a colloidal solution (sol) that acts as

In materials science, the sol-gel process is a method for producing solid materials from small molecules. The method is used for the fabrication of metal oxides, especially the oxides of silicon (Si) and titanium (Ti).
